Clinical Appropriateness Guidelines: Advanced Imaging

Appropriate Use Criteria: Pediatric Head & Neck
Effective Date: September 5, 2017

Proprietary
# Table of Contents

**Description and Application of the Guidelines**

**Administrative Guidelines**
- Ordering of Multiple Studies ......................................................... 4
- Pre-test Requirements ........................................................................... 5

**Head & Neck Imaging**
- CT of the Head – Pediatrics ................................................................. 6
- MRI of the Head/Brain – Pediatrics .................................................... 13
- CTA/MRA Head: Cerebrovascular – Pediatrics .................................. 20
- Functional MRI (fMRI) Brain – Pediatrics ........................................ 23
- PET Brain Imaging – Pediatrics .......................................................... 24
- CT Orbit, Sella Turcica, Posterior Fossa, Temporal Bone, including Mastoids – Pediatrics .................................................. 25
- MRI Orbit, Face & Neck (Soft Tissues) – Pediatrics ........................ 28
- CT Paranasal Sinus & Maxillofacial Area – Pediatrics ....................... 32
- MRI Temporomandibular Joint (TMJ) – Pediatrics ............................ 35
- CT Neck for Soft Tissue Evaluation – Pediatrics ............................... 36
- CTA/MRA of the Neck – Pediatrics ................................................... 39
AIM's Clinical Appropriateness Guidelines (hereinafter “AIM's Clinical Appropriateness Guidelines” or the “Guidelines”) are designed to assist providers in making the most appropriate treatment decision for a specific clinical condition for an individual. As used by AIM, the Guidelines establish objective and evidence-based, where possible, criteria for medical necessity determinations. In the process, multiple functions are accomplished:

- To establish criteria for when services are medically necessary
- To assist the practitioner as an educational tool
- To encourage standardization of medical practice patterns
- To curtail the performance of inappropriate and/or duplicate services
- To advocate for patient safety concerns
- To enhance the quality of healthcare
- To promote the most efficient and cost-effective use of services

AIM's guideline development process complies with applicable accreditation standards, including the requirement that the Guidelines be developed with involvement from appropriate providers with current clinical expertise relevant to the Guidelines under review and be based on the most up to date clinical principles and best practices. Relevant citations are included in the “References” section attached to each Guideline. AIM reviews all of its Guidelines at least annually.

AIM makes its Guidelines publicly available on its website twenty-four hours a day, seven days a week. Copies of AIM's Clinical Appropriateness Guidelines are also available upon oral or written request. Although the Guidelines are publicly-available, AIM considers the Guidelines to be important, proprietary information of AIM, which cannot be sold, assigned, leased, licensed, reproduced or distributed without the written consent of AIM.

AIM applies objective and evidence-based criteria and takes individual circumstances and the local delivery system into account when determining the medical appropriateness of health care services. The AIM Guidelines are just guidelines for the provision of specialty health services. These criteria are designed to guide both providers and reviewers to the most appropriate services based on a patient’s unique circumstances. In all cases, clinical judgment consistent with the standards of good medical practice should be used when applying the Guidelines. Guideline determinations are made based on the information provided at the time of the request. It is expected that medical necessity decisions may change as new information is provided or based on unique aspects of the patient's condition. The treating clinician has final authority and responsibility for treatment decisions regarding the care of the patient and for justifying and demonstrating the existence of medical necessity for the requested service. The Guidelines are not a substitute for the experience and judgment of a physician or other health care professionals. Any clinician seeking to apply or consult the Guidelines is expected to use independent medical judgment in the context of individual clinical circumstances to determine any patient’s care or treatment.

The Guidelines do not address coverage, benefit or other plan specific issues. If requested by a health plan, AIM will review requests based on health plan medical policy/guidelines in lieu of AIM's Guidelines.

The Guidelines may also be used by the health plan or by AIM for purposes of provider education, or to review the medical necessity of services by any provider who has been notified of the need for medical necessity review, due to billing practices or claims that are not consistent with other providers in terms of frequency or some other manner.

CPT® (Current Procedural Terminology) is a registered trademark of the American Medical Association (AMA). CPT® five digit codes, nomenclature and other data are copyright by the American Medical Association. All Rights Reserved. AMA does not directly or indirectly practice medicine or dispense medical services. AMA assumes no liability for the data contained herein or not contained herein.
Requests for multiple imaging studies to evaluate a suspected or identified condition and requests for repeated imaging of the same anatomic area are subject to additional review to avoid unnecessary or inappropriate imaging.

**Simultaneous Ordering of Multiple Studies**

In many situations, ordering multiple imaging studies at the same time is not clinically appropriate because:

- Current literature and/or standards of medical practice support that one of the requested imaging studies is more appropriate in the clinical situation presented; or
- One of the imaging studies requested is more likely to improve patient outcomes based on current literature and/or standards of medical practice; or
- Appropriateness of additional imaging is dependent on the results of the lead study.

When multiple imaging studies are ordered, the request will often require a peer-to-peer conversation to understand the individual circumstances that support the medically necessity of performing all imaging studies simultaneously.

Examples of multiple imaging studies that may require a peer-to-peer conversation include:

- CT brain and CT sinus for headache
- MRI brain and MRA brain for headache
- MRI cervical spine and MRI shoulder for pain indications
- MRI lumbar spine and MRI hip for pain indications
- MRI or CT of multiple spine levels for pain or radicular indications
- MRI foot and MRI ankle for pain indications
- Bilateral exams, particularly comparison studies

There are certain clinical scenarios where simultaneous ordering of multiple imaging studies is consistent with current literature and/or standards of medical practice. These include:

- Oncologic imaging – Considerations include the type of malignancy and the point along the care continuum at which imaging is requested
- Conditions which span multiple anatomic regions – Examples include certain gastrointestinal indications or congenital spinal anomalies

**Repeated Imaging**

In general, repeated imaging of the same anatomic area should be limited to evaluation following an intervention, or when there is a change in clinical status such that imaging is required to determine next steps in management. At times, repeated imaging done with different techniques or contrast regimens may be necessary to clarify a finding seen on the original study.

Repeated imaging of the same anatomic area (with same or similar technology) may be subject to additional review in the following scenarios:

- Repeated imaging at the same facility due to motion artifact or other technical issues
- Repeated imaging requested at a different facility due to provider preference or quality concerns
- Repeated imaging of the same anatomic area (MRI or CT) based on persistent symptoms with no clinical change, treatment, or intervention since the previous study
- Repeated imaging of the same anatomical area by different providers for the same member over a short period of time
Critical to any finding of clinical appropriateness under the guidelines for specific imaging exams is a determination that the following are true with respect to the imaging request:

- A clinical evaluation has been performed prior to the imaging request (which should include a complete history and physical exam and review of results from relevant laboratory studies, prior imaging and supplementary testing) to identify suspected or established diseases or conditions.

- **For suspected diseases or conditions:**
  - Based on the clinical evaluation, there is a reasonable likelihood of disease prior to imaging; and
  - Current literature and standards of medical practice support that the requested imaging study is the most appropriate method of narrowing the differential diagnosis generated through the clinical evaluation and can be reasonably expected to lead to a change in management of the patient; and
  - The imaging requested is reasonably expected to improve patient outcomes based on current literature and standards of medical practice.

- **For established diseases or conditions:**
  - Advanced imaging is needed to determine whether the extent or nature of the disease or condition has changed; and
  - Current literature and standards of medical practice support that the requested imaging study is the most appropriate method of determining this and can be reasonably expected to lead to a change in management of the patient; and
  - The imaging requested is reasonably expected to improve patient outcomes based on current literature and standards of medical practice.

- If these elements are not established with respect to a given request, the determination of appropriateness will most likely require a peer-to-peer conversation to understand the individual and unique facts that would supersede the pre-test requirements set forth above. During the peer-to-peer conversation, factors such as patient acuity and setting of service may also be taken into account.

Standard Anatomic Coverage

- From the skull base to vertex, covering the entire calvarium and intracranial contents
- Scan coverage may vary, depending on the specific clinical indication

Technology Considerations

- MRI of the head is preferable to CT in most clinical scenarios, due to its superior contrast resolution and lack of beam-hardening artifact adjacent to the petrous bone (which may limit visualization in portions of the posterior fossa and brainstem on CT)
- Exceptions to the use of brain MRI as the neuroimaging study of choice and clinical situations where CT head is preferred:
  - Initial evaluation of recent craniocerebral trauma
  - Evaluation of acute intracranial hemorrhage (parenchymal, subarachnoid, subdural, epidural)
  - Evaluation of calcified intracranial lesions
  - Osseous assessment of the calvarium, skull base and maxillofacial bones, including detection of calvarial and facial bone fractures

Common Diagnostic Indications

This section begins with general pediatric indications for CT Head, followed by neurologic signs and symptoms and vascular indications.

General Head/Brain

Abnormal imaging findings

Follow up of abnormal or indeterminate findings on a prior imaging study when required to direct treatment

Ataxia, congenital or hereditary

Examples include ataxia-telangiectasia, fragile X syndrome, congenital anomalies of the posterior fossa.

Congenital or developmental anomaly

Diagnosis or management (including perioperative evaluation) of a suspected or known congenital anomaly or developmental condition

Examples include Chiari malformation, craniosynostosis, macrocephaly, and microcephaly.

- Ultrasound is required as the initial study to evaluate macrocephaly in patients under 5 months of age.
Common Diagnostic Indications

Developmental delay
Evaluation of either of the following conditions:
  ● Cerebral palsy
  ● Global developmental delay, defined as significant delay or loss of milestones in at least two of the following domains:
    ○ Activities of daily living
    ○ Cognition
    ○ Motor skills (gross/fine)
    ○ Social/personal
    ○ Speech/language

Hearing loss
Evaluation for a structural cause of conductive, sensorineural or mixed hearing loss

Note: MRI is preferred for sensorineural hearing loss. CT is preferred for conductive or mixed hearing loss.

Horner's syndrome**
**Requires contraindication to MRI

Hydrocephalus/ventricular assessment
  ● Evaluation of signs or symptoms suggestive of increased intracranial pressure or hydrocephalus
    ○ Ultrasound is required as the initial study in patients under 5 months of age
  ● Management of established hydrocephalus and ventricular shunts

Infectious disease
Diagnosis or management (including perioperative evaluation) of parenchymal lesions associated with CNS infection

Inflammatory disease
Diagnosis or management of inflammatory disease with CNS involvement

Lumbar puncture risk assessment
Evaluation prior to lumbar puncture when at least one of the following is present
  ● Papilledema
  ● Absent venous pulsations on funduscopic exam
  ● Altered mental status
  ● Abnormal neurological exam
  ● Evidence for meningeal irritation

Multiple sclerosis and other white-matter diseases**
  ● Diagnosis of suspected demyelinating disease
  ● Management or surveillance of established disease
**Requires contraindication to MRI

Neurocutaneous disorders
Diagnosis or management (including perioperative evaluation) of CNS lesions associated with a known neurocutaneous disorder
  Examples include neurofibromatosis, Sturge-Weber syndrome, tuberous sclerosis, and von Hippel-Lindau disease.

Papilledema
Common Diagnostic Indications

Pseudotumor cerebri

Seizures and epilepsy

Neonatal/Infantile seizure (age 2 years or younger)
- Initial evaluation of seizure not associated with fever
- Periodic follow-up at 6-month intervals up to 30 months, if initial imaging study is non-diagnostic

Childhood/Adolescent seizure (over age 2)
- When at least one of the following is present:
  - Focal neurologic findings at the time of the seizure
  - Persistent neurologic deficit in the postictal period
  - Idiopathic epilepsy with atypical clinical course
  - Partial seizures
  - Seizures increasing in frequency and severity despite optimal medical management
  - Electroencephalogram (EEG) findings inconsistent with idiopathic epilepsy

Complex febrile seizure (age 6 months – 5 years)
- When either of the following is present:
  - More than one seizure during a febrile period
  - Seizure lasting longer than 15 minutes

Note: Imaging is not generally indicated for simple febrile seizures.

Trauma

Evaluation following head trauma when at least one of the following is present:
- Non-accidental injury (NAI)
- Trauma associated with any of the following features:
  - Altered mental status
  - Change in behavior
  - Vomiting
  - Loss of consciousness
  - History of high risk MVA or other mechanism of injury
  - Scalp hematoma if less than 2 years of age
  - Evidence of basilar skull fracture

Note: This indication does not apply to patients with bleeding diathesis or intracranial shunts.

Tumor (benign or malignant)
- Diagnosis of suspected tumor when supported by the clinical presentation
- Management (including perioperative evaluation) of established tumor when imaging is required to direct treatment
- Surveillance of established tumor
Common Diagnostic Indications

Neurologic Signs & Symptoms

This section contains indications for Bell’s palsy, headache, mental status change, syncope, vertigo/dizziness, and visual disturbance.

Advanced imaging based on nonspecific signs or symptoms is subject to a high level of clinical review.

Appropriateness of imaging depends upon the context in which it is requested. At a minimum, this includes a differential diagnosis and temporal component, along with documented findings on physical exam.

Additional considerations which may be relevant include comorbidities, risk factors, and likelihood of disease based on age and gender.

In general, the utility of structural brain imaging is limited to the following categories, each with a unique set of clinical presentations:

- Identification of a space occupying lesion or other focal abnormality (tumor, CVA)
- Detection of parenchymal abnormalities (atrophy, demyelinating disease, infection, ischemic change)
- Identification of ventricular abnormalities (hydrocephalus)

There are a number of common symptoms or conditions for which the likelihood of an underlying central nervous system process is extremely low. The following indications include specific considerations and requirements which help to determine appropriateness of advanced imaging for these symptoms.

**Bell’s palsy (peripheral facial weakness)**

- When associated with additional neurologic findings suggestive of intracranial pathology
- Symptoms persisting beyond six (6) weeks in the absence of additional neurologic findings

**Headache**

Onset within the past 30 days with no prior history of headache, when at least one of the following is present:

- Personal or family history of disorders that may predispose one to central nervous system (CNS) lesions and clinical findings suggesting CNS involvement (including, but not limited to, vascular malformations, aneurysms, brain neoplasms, infectious/inflammatory conditions such as sarcoidosis or personal history of meningitis and tuberculosis)
- Associated neurologic findings on physical exam
- Developmental delay
- Headache that awakens the patient repeatedly from sleep or develops upon awakening
- Sudden onset and severe headache (includes thunderclap headache or worst headache of life)

Persistent or recurrent headache, when at least one of the following is present:

- Change in quality (pattern or intensity) of a previously stable headache
- Headache persisting for a period of up to 6 months duration and not responsive to medical treatment, and no prior imaging has been done to evaluate the headache
- Headache associated with at least one of the following:
  - Abnormal reflexes
  - Altered mental status
  - Cranial nerve deficit
  - Gait/motor dysfunction
  - Nystagmus
  - Seizure
  - Sensory deficit
  - Sign of increased intracranial pressure (increased head circumference, vomiting, papilledema, symptoms that worsen with valsalva)

**Note:** Imaging is not generally indicated for typical presentations of migraine.
Common Diagnostic Indications

Mental status change (including encephalopathy), with documented evidence on neurologic exam

**Syncope**
Evaluation for a structural brain lesion when associated with any of following:
- Seizure activity was witnessed or is highly suspected at the time of the episode.
- There is a documented abnormality on neurological examination.
- At least one persistent neurological symptom is present

**Vertigo and dizziness**
- Evaluation of signs or symptoms suggestive of a CNS lesion
- Symptoms associated with abnormal audiogram or auditory brainstem response

*Note:* Vertigo or dizziness which is clearly related to positional change does not require advanced imaging.

**Visual disturbance**
Evaluation for central nervous system pathology when suggested by the ophthalmologic exam

**Vascular indications**
This section contains indications for aneurysm, cerebrovascular accident/transient ischemic attack, hemorrhage/hematoma, and other vascular abnormalities.

**Aneurysm**
- **Screening** in asymptomatic, high-risk individuals
  - At least two (2) first degree relatives with intracranial aneurysm or subarachnoid hemorrhage
  - Presence of a heritable condition which predisposes to intracranial aneurysm (examples include autosomal dominant polycystic kidney disease and Ehlers-Danlos syndrome type IV)
- **Diagnosis** of suspected aneurysm based on neurologic signs or symptoms (for isolated headache, see *Headache* indication)
- **Management** (including perioperative evaluation) of known (treated or untreated) intracranial aneurysm when associated with new or worsening neurologic symptoms
- **Surveillance** of known aneurysm in the absence of new or worsening symptoms
  - Initial evaluation at 6–12 months following diagnosis, then every 1–2 years
  - Follow-up after treatment with clips, endovascular coil or stenting

**Cerebrovascular accident (CVA or stroke) and transient ischemic attack (TIA)**

**Hemorrhage/hematoma**

**Other vascular abnormalities**
- Arteriovenous malformation (AVM)
- Cavernous malformation
- Cerebral vein thrombosis
- Dural arteriovenous fistula (DAVF)
- Dural venous sinus thrombosis
- Venous angioma

*Note:* CTA or MRA is generally preferred for these indications.

**Papilledema**

**Pseudotumor cerebri**
Common Diagnostic Indications

Seizures and epilepsy

Neonatal/Infantile seizure (age 2 years or younger)
- Initial evaluation of seizure not associated with fever
- Periodic follow-up at 6-month intervals up to 30 months, if initial imaging study is non-diagnostic

Childhood/Adolescent seizure (over age 2)
- When at least one of the following is present:
  - Focal neurologic findings at the time of the seizure
  - Persistent neurologic deficit in the postictal period
  - Idiopathic epilepsy with atypical clinical course
  - Partial seizures
  - Seizures increasing in frequency and severity despite optimal medical management
  - Electroencephalogram (EEG) findings inconsistent with idiopathic epilepsy

Complex febrile seizure (age 6 months – 5 years)
- When either of the following is present:
  - More than one seizure during a febrile period
  - Seizure lasting longer than 15 minutes

Note: Imaging is not generally indicated for simple febrile seizures.

Trauma

Evaluation following head trauma when at least one of the following is present:
- Non-accidental injury (NAI)
- Trauma associated with any of the following features:
  - Altered mental status
  - Change in behavior
  - Vomiting
  - Loss of consciousness
  - History of high risk MVA or other mechanism of injury
  - Scalp hematoma if less than 2 years of age
  - Evidence of basilar skull fracture

Note: This indication does not apply to patients with bleeding diathesis or intracranial shunts.

Tumor (benign or malignant)
- Diagnosis of suspected tumor when supported by the clinical presentation
- Management (including perioperative evaluation) of established tumor when imaging is required to direct treatment
- Surveillance of established tumor
### Common Diagnostic Indications

#### Neurologic Signs & Symptoms

This section contains indications for Bell’s palsy, headache, mental status change, syncope, vertigo/dizziness, and visual disturbance.

Advanced imaging based on nonspecific signs or symptoms is subject to a high level of clinical review. Appropriate-ness of imaging depends upon the context in which it is requested. At a minimum, this includes a differential diagnosis and temporal component, along with documented findings on physical exam.

Additional considerations which may be relevant include comorbidities, risk factors, and likelihood of disease based on age and gender.

In general, the utility of structural brain imaging is limited to the following categories, each with a unique set of clinical presentations:

- Identification of a space occupying lesion or other focal abnormality (tumor, CVA)
- Detection of parenchymal abnormalities (atrophy, demyelinating disease, infection, ischemic change)
- Identification of ventricular abnormalities (hydrocephalus)

There are a number of common symptoms or conditions for which the likelihood of an underlying central nervous system process is extremely low. The following indications include specific considerations and requirements which help to determine appropriateness of advanced imaging for these symptoms.

#### Bell's palsy (peripheral facial weakness)

- When associated with additional neurologic findings suggestive of intracranial pathology
- Symptoms persisting beyond six (6) weeks in the absence of additional neurologic findings

#### Headache

Onset within the past 30 days with no prior history of headache, when at least one of the following is present:

- Personal or family history of disorders that may predispose one to central nervous system (CNS) lesions and clinical findings suggesting CNS involvement (including, but not limited to, vascular malformations, aneurysms, brain neoplasms, infectious/inflammatory conditions such as sarcoidosis or personal history of meningitis and tuberculosis)
- Associated neurologic findings on physical exam
- Developmental delay
- Headache that awakens the patient repeatedly from sleep or develops upon awakening
- Sudden onset and severe headache (includes thunderclap headache or worst headache of life)

Persistent or recurrent headache, when at least one of the following is present:

- Change in quality (pattern or intensity) of a previously stable headache
- Headache persisting for a period of up to 6 months duration and not responsive to medical treatment, and no prior imaging has been done to evaluate the headache
- Headache associated with at least one of the following:
  - Abnormal reflexes
  - Altered mental status
  - Cranial nerve deficit
  - Gait/motor dysfunction
  - Nystagmus
  - Seizure
  - Sensory deficit
  - Sign of increased intracranial pressure (increased head circumference, vomiting, papilledema, symptoms that worsen with valsalva)

**Note:** Imaging is not generally indicated for typical presentations of migraine.
## Common Diagnostic Indications

### Mental status change (including encephalopathy), with documented evidence on neurologic exam

**Syncope**
Evaluation for a structural brain lesion when associated with any of following:
- Seizure activity was witnessed or is highly suspected at the time of the episode.
- There is a documented abnormality on neurological examination.
- At least one persistent neurological symptom is present

### Vertigo and dizziness
- Evaluation of signs or symptoms suggestive of a CNS lesion
- Symptoms associated with abnormal audiogram or auditory brainstem response

**Note:** Vertigo or dizziness which is clearly related to positional change does not require advanced imaging.

### Visual disturbance
Evaluation for central nervous system pathology when suggested by the ophthalmologic exam

### Vascular indications
This section contains indications for aneurysm, cerebrovascular accident/transient ischemic attack, hemorrhage/hematoma, and other vascular abnormalities.

#### Aneurysm
- **Screening** in asymptomatic high-risk individuals
  - At least two (2) first degree relatives with intracranial aneurysm or subarachnoid hemorrhage
  - Presence of a heritable condition which predisposes to intracranial aneurysm (examples include autosomal dominant polycystic kidney disease and Ehlers-Danlos syndrome type IV)
- **Diagnosis** of suspected aneurysm based on neurologic signs or symptoms (for isolated headache, see Headache indication)
- **Management** (including perioperative evaluation) of known (treated or untreated) intracranial aneurysm when associated with new or worsening neurologic symptoms
- **Surveillance** of known aneurysm in the absence of new or worsening symptoms
  - Initial evaluation at 6–12 months following diagnosis, then every 1–2 years
  - Follow-up after treatment with clips, endovascular coil or stenting

#### Cerebrovascular accident (CVA or stroke) and transient ischemic attack (TIA)

#### Hemorrhage/hematoma

#### Other vascular abnormalities
- Arteriovenous malformation (AVM)
- Cavernous malformation
- Cerebral vein thrombosis
- Dural arteriovenous fistula (DAVF)
- Dural venous sinus thrombosis
- Venous angioma

**Note:** CTA or MRA is generally preferred for these indications.

CT Angiography (CTA) and MR Angiography (MRA) Head: Cerebrovascular – Pediatrics

CPT Codes

70496.................. Computed tomographic angiography, head, with contrast material(s), including noncontrast images, if performed, and image postprocessing
70544.................. Magnetic resonance angiography, head, without contrast
70545.................. Magnetic resonance angiography, head, with contrast
70546.................. Magnetic resonance angiography, head, without contrast, followed by re-imaging with contrast

Angiography includes imaging of all blood vessels, including arteries and veins. The codes above include CT/MR Venography.

Standard Anatomic Coverage

- CTA or MRA may be performed to assess the major intracranial arteries of the anterior and posterior circulations (including the Circle of Willis) as well as the venous structures (major cerebral veins and dural venous sinuses).
- For specific clinical indications, exams may be tailored to the region of interest.
- MRA of the head includes imaging of the entire arteriovenous system of the brain. Separate requests for concurrent imaging of the arteries and the veins in the head are inappropriate.

Choice of Imaging Study

Advantages of CTA

- Higher sensitivity for detection of mural calcification
- Absence of in-plane flow phenomenon which can exaggerate the degree of stenosis
- Improved detection of surgical clips and stents
- Shorter scan time, resulting in less motion artifact and better quality images

Advantages of MRA

- Provides information about the age of blood
- No need for iodinated contrast material
- No exposure to ionizing radiation

Combination with MRI

- In the majority of clinical situations, appropriateness of a second imaging study is dependent on the results of the lead study. This is particularly true with regard to MRI and MRA of the same anatomic region, as there is considerable overlap in visualizing vascular structures. Therefore, it is prudent to begin with the optimal study for the indication requested.
- When ordered in combination, peer to peer conversation will be required to understand the individual and unique facts that would support the medical necessity of all imaging studies requested.

Common Diagnostic Indications

Abnormal imaging findings

Follow up of abnormal or indeterminate findings on a prior imaging study when required to direct treatment
Common Diagnostic Indications

Aneurysm
- **Screening** in asymptomatic, high-risk individuals
  - At least two (2) first degree relatives with intracranial aneurysm or subarachnoid hemorrhage
  - Presence of a heritable condition which predisposes to intracranial aneurysm (examples include autosomal dominant polycystic kidney disease and Ehlers-Danlos syndrome type IV)
- **Diagnosis** of suspected aneurysm based on neurologic signs or symptoms (for isolated headache, see Headache indication)
- **Management** (including perioperative evaluation) of known (treated or untreated) intracranial aneurysm when associated with new or worsening neurologic symptoms
- **Surveillance** of known aneurysm in the absence of new or worsening symptoms
  - Initial evaluation at 6–12 months following diagnosis, then every 1–2 years
  - Follow-up after treatment with clips, endovascular coil or stenting

Cerebrovascular accident (CVA)
- Evaluation for stenosis or occlusion of the intracranial arteries following confirmation of recent non-hemorrhagic CVA on MRI, CT or ultrasound of the brain
- Evaluation for a vascular etiology following confirmation of a recent hemorrhagic CVA on MRI, CT or ultrasound of the brain

Congenital or developmental vascular anomaly
Diagnosis or management (including perioperative or periprocedural management) of a suspected or known cerebrovascular anomaly
*Examples include arteriovenous malformation (AVM), cavernous malformation, dural arteriovenous fistula (DAVF).*

Dissection
Diagnosis or management (including perioperative evaluation) of intracranial arterial dissection

Headache
Evaluation for a vascular etiology when **at least one** of the following is present:
- Exertional headache
- Positional headache
- Sudden onset of worst headache of life

Hemorrhage / hematoma

Pulsatile tinnitus
- Evaluation for vascular etiology

Stenosis or occlusion of intracranial arteries
- Diagnosis or management of known or suspected steno-occlusive disease
*Examples include Moyamoya disease, sickle cell anemia, and idiopathic progressive arteriopathy of childhood.*

Thromboembolic disease of major intracranial arterial or venous systems

Trauma
- When vascular involvement is known or suspected

Tumor (benign or malignant)
- Evaluation of vascular supply to established tumor
Common Diagnostic Indications

**Vasculitis**
Diagnosis or management of vasculitis with known or suspected CNS involvement

**Venous thrombosis or compression**

**References**

Functional Magnetic Resonance Imaging (fMRI) Brain – Pediatrics

CPT Codes

- 70554. Magnetic resonance imaging, brain, functional MRI; including test selection and administration of repetitive body part movement and/or visual stimulation, not requiring physician or psychologist administration
- 70555. Magnetic resonance imaging, brain, functional MRI; including test selection and administration of repetitive body part movement and/or visual stimulation, requiring physician or psychologist administration of entire neurofunctional testing

Standard Anatomic Coverage

- From the skull base to vertex, covering the intracranial contents
- Scan coverage may vary, depending on the specific clinical indication

Technology Considerations

- Functional MRI of the brain may be used to localize eloquent areas in the brain, prior to resection of neoplasm or medically intractable epileptogenic foci.
- Studies have shown excellent agreement in language localization, when comparing functional brain MRI with the Wada test and direct electrical stimulation.
- Advantages of functional brain MRI over a Wada test include the non-invasive technique (not requiring catheter placement and contrast injection), lack of ionizing radiation, shorter time-requirement, lower cost and quicker post-procedural recovery. Additionally, the Wada test is considered limited in right hemisphere dominance.
- Advantages of functional brain MRI over intraoperative electrocortical stimulation include its non-invasive technique and more extensive anatomic brain mapping. Direct electrical stimulation is an invasive procedure, which usually evaluates only one hemisphere (limiting assessment for partial or bilateral language dominance) and usually identifies only eloquent brain regions on the surface of the brain.
- Functional MRI may successfully map primary brain activities related to motor, sensory and language functions. Examples of tasks which may be used include sentence completion (to map language) and bilateral hand squeeze task (for sensory motor mapping).

Common Diagnostic Indications

**Brain tumor**
- For preoperative neurosurgical planning, as a replacement for a Wada test or direct electrical stimulation mapping

**Seizures/epilepsy refractory to medical treatment**
- For preoperative neurosurgical planning, as a replacement for a Wada test or direct electrical stimulation mapping
PET Brain Imaging – Pediatrics

CPT Codes

- 78608 .................. PET brain, metabolic evaluation
- 78609 .................. PET brain, perfusion evaluation

Commonly Used Radiopharmaceuticals

- 2-(fluorine-18) fluoro-2-deoxy-d-glucose (FDG) Scan coverage may vary, depending on the specific clinical indication

Common Diagnostic Indications

Brain tumor
- Diagnosis or staging
- Differentiation of post treatment scarring from residual or recurrent disease

Refractory seizures/epilepsy
- Presurgical evaluation to identify a focus of seizure activity in patients who have failed conventional medical therapy

References

Computed Tomography (CT) Orbit, Sella Turcica, Posterior Fossa, Temporal Bone, including Mastoids – Pediatrics

CPT Codes

- 70480................. CT of orbit, sella or posterior fossa and outer, middle or inner ear, without contrast
- 70481................. CT of orbit, sella or posterior fossa and outer, middle or inner ear, with contrast
- 70482................. CT of orbit, sella or posterior fossa and outer, middle or inner ear, without contrast, followed by re-imaging with contrast

Standard Anatomic Coverage

- The anatomic coverage and protocol specifications will vary, depending on the clinical indication. Anatomic evaluation includes the internal auditory canals (IACs), posterior fossa, sella turcica, orbits and temporal bone, with the mastoid air cells.
- Targeted evaluation, such as CT of the temporal bones, involves collimated views through the region of interest, often in two imaging planes: axial images (petrous bones through mastoid tips) and coronal views (temporomandibular joints through temporal bones).

Technology Considerations

- CT is often the preferred study for suspected fracture or follow-up of a known fracture, foreign body detection, assessment of calcified lesions and temporal bone evaluation.
- With capability for high-resolution osseous imaging, CT can provide detailed anatomic depiction of the temporal bone anatomy, including the middle and inner ear structures.
- MRI (unless contraindicated) is usually preferred over CT for evaluation of the sella turcica, internal auditory canal regions and visual pathways, as well as for most soft tissue tumor evaluation.
- Bony changes from a sellar, parasellar or orbital mass or infectious process are usually well demonstrated by CT.

Common Diagnostic Indications

This section begins with general pediatric indications, followed by orbital and otic indications.

General indications

Abnormal imaging findings
- Follow up of abnormal or indeterminate findings on a prior imaging study when required to direct treatment

Congenital or developmental anomaly
- Diagnosis or management (including perioperative evaluation) of a suspected or known congenital anomaly or developmental condition of the orbit, temporal bone, sella turcica or posterior fossa (see Standard Anatomic Coverage for detail)

Infectious disease
- Diagnosis or management (including perioperative evaluation) of infection involving the orbit, temporal bone, sella turcica or posterior fossa

Inflammatory disease
- Diagnosis or management of inflammatory disease known to involve the orbit, temporal bone, sella turcica or posterior fossa

Localized facial pain – when persistent and unexplained
Common Diagnostic Indications

Osseous lesions
Examples include fibrous dysplasia, Paget’s disease, and otosclerosis.

Trauma to the orbit, temporal bone, or skull base

Tumor (benign or malignant)
Diagnosis or management (including perioperative evaluation) of benign or malignant tumor of the orbit, temporal bone, sella turcica or posterior fossa

Orbital indications

Evaluation of any of the following:
- Absence of red reflex
- Dysconjugate gaze
- Exophthalmos (or proptosis)
- Extraocular muscle weakness
- Nystagmus
- Optic neuritis
- Orbital pseudotumor
- Papilledema
- Strabismus
- Thyroid ophthalmopathy

Foreign body in the orbit
- Following non-diagnostic radiograph

Visual disturbance
Evaluation for orbital or optic nerve pathology when suggested by the ophthalmologic exam

Otic indications

Cholesteatoma

Cochlear implant
Preoperative and post-operative evaluation

Hearing loss
Evaluation for a structural cause of conductive, sensorineural or mixed hearing loss

Note: CT is preferred for conductive or mixed hearing loss. MRI is preferred for sensorineural hearing loss.

Pulsatile tinnitus

Vertigo and dizziness
- Evaluation of signs or symptoms suggestive of a CNS lesion
- Symptoms associated with abnormal audiogram or auditory brainstem response

Note: Vertigo or dizziness which is clearly related to positional change does not require advanced imaging.
References

CPT Codes

- 70540: MRI orbit, face and neck, without contrast
- 70542: MRI orbit, face and neck, with contrast
- 70543: MRI orbit, face and neck, without contrast, followed by re-imaging with contrast

Standard Anatomic Coverage

- Scan coverage is dependent on the specific anatomic area of clinical interest and may include the following:
  - Facial structures
  - Larynx and subglottic regions
  - Nasopharynx, oropharynx and hypopharynx
  - Neck soft tissues, surrounding the airway and glands
  - Optic nerve
  - Orbit
  - Salivary glands
  - Sinuses
  - Thyroid and parathyroid gland

Choice of Imaging Study

- CT is generally the modality of choice for traumatic injury, calcified lesions, localized infection (for example, orbital extension of an adjacent complicated sinusitis), and foreign body evaluation following initial radiographic evaluation for a radiopaque foreign body.
- CT is preferred for visualization of soft tissue structures in the neck.
- MRI of the orbit, face and neck is not indicated for imaging the internal auditory canals (see MRI brain, CPT codes 70551–70553).

Common Diagnostic Indications

This section begins with general pediatric indications, followed by nasal, neck, and orbital indications.

**General indications**

**Abnormal imaging findings**

Follow up of abnormal or indeterminate findings on a prior imaging study when required to direct treatment

**Congenital anomalies**

Diagnosis or management (including perioperative evaluation) of a suspected or known congenital anomaly of the orbit, maxillofacial area, or soft tissue structures of the neck (see Standard Anatomic Coverage for detail)

**Horner's syndrome**

**Infectious disease (excluding sinusitis)**

Diagnosis or management (including perioperative evaluation) of infection involving the orbit, maxillofacial area, or soft tissue of the neck

*Note:* For sinus infection, see CT Paranasal Sinus and Maxillofacial Area
## Common Diagnostic Indications

### Inflammatory disease
Diagnosis or management of inflammatory disease known to involve the orbit, maxillofacial area, or soft tissue structures of the neck

*Example* includes Wegener’s granulomatosis (granulomatosis with polyangiitis)

### Osteonecrosis of the jaw
- Evaluation following non-diagnostic Panorex/radiographs

### Trauma to facial structures or soft tissues of the neck

### Tumor (benign or malignant)
Diagnosis or management (including perioperative evaluation) of suspected or known malignancy when imaging is required to direct treatment

### Nasal indications

Evaluation of any of the following:
- Anosmia
- Recurrent epistaxis
- Nasal airway obstruction or polyposis refractory to medical therapy

### Neck indications

#### Hoarseness, dysphonia or vocal cord weakness/paralysis
- Following laryngoscopy, when findings suggest recurrent laryngeal nerve dysfunction or identify a suspicious lesion
- Symptoms persisting longer than one month which are unexplained by laryngoscopy

#### Lymphadenopathy
Evaluation of unexplained lymphadenopathy in any of the following clinical scenarios:
- Ultrasound findings suggestive of nodal malignancy
- Non-diagnostic ultrasound and failure to resolve following a six (6) week course of empiric therapy
- Non-diagnostic ultrasound and presence of *at least one* of the following features:
  - Constitutional symptoms
  - Firm/immobile and larger than 3 cm in diameter
  - Persistent enlargement on exam for longer than 2 weeks
  - Presence of ulceration
  - Supraclavicular or posterior triangle location

*Note: Biopsy may be more appropriate than imaging when any of these features are present.*

### Neck mass
- Initial evaluation of a palpable neck mass when ultrasound demonstrates a solid mass other than a lymph node
- Management of known cystic neck mass or other benign tumor when ultrasound is not sufficient to guide treatment
- Evaluation of a retropharyngeal neck mass

### Parathyroid adenoma
- Evaluation of suspected adenoma following abnormal parathyroid ultrasound or scintigraphy
- Preoperative planning in patients with aberrant anatomy
- Localization of residual parathyroid tissue following failed parathyroidectomy
Common Diagnostic Indications

**Stridor**
- Evaluation of acute stridor
- For subacute or chronic stridor, following non-diagnostic radiograph and ENT evaluation

**Thyroid nodule or thyromegaly (goiter)**
- Following non-diagnostic thyroid ultrasound or thyroid scintigraphy
- When associated with mass effect on the upper airway or esophagus
- For preoperative evaluation

**Torticollis**
- Evaluation of childhood (acquired) torticollis when clinical findings suggest a secondary cause (such as infection, neoplasm, trauma)
- Evaluation of congenital muscular torticollis when all of the following apply:
  - Age 8 months or younger
  - Following non-diagnostic ultrasound of the neck
  - Following non-diagnostic cervical spine radiograph
  - Failure to respond to at least four (4) weeks of conservative treatment

**Tracheal stenosis**

**Upper airway obstruction**

**Orbital indications**

**Evaluation of any of the following:**
- Absence of red reflex
- Dysconjugate gaze
- Exophthalmos (or proptosis)
- Extraocular muscle weakness
- Nystagmus
- Optic neuritis
- Orbital pseudotumor
- Papilledema
- Strabismus
- Thyroid ophthalmopathy

**Visual disturbance**

Evaluation for orbital or optic nerve pathology when suggested by the ophthalmologic exam
References

Composed Tomography (CT) Paranasal Sinus & Maxillofacial Area – Pediatrics

CPT Codes

70486.................. CT of maxillofacial area, without contrast
70487.................. CT of maxillofacial area, with contrast
70488.................. CT of maxillofacial area, without contrast, followed by re-imaging with contrast

Standard Anatomic Coverage

- Includes the sinuses, facial structures and maxillary regions. Individual scan coverage depends on the specific clinical request, but generally includes images through the entire frontal, ethmoid, maxillary and sphenoid sinuses. Coverage may be extended to include the mandible and temporomandibular joint (TMJ) in select cases and depending on the clinical indication. CT sections may be obtained in one or two (usually coronal and axial) planes.

Common Diagnostic Indications

Abnormal imaging findings
Follow up of abnormal or indeterminate findings on a prior imaging study when required to direct treatment

Congenital anomaly
Diagnosis or management (including perioperative evaluation) of a suspected or known congenital maxillofacial anomaly when imaging is required to direct treatment

Infectious disease
Diagnosis or management (including perioperative evaluation) of the following:
- Fungal or other complex sinus infections
- Osteomyelitis of the facial bones

Inflammatory disease
Diagnosis or management of inflammatory disease known to involve the maxillofacial region
Examples include Wegener’s granulomatosis (granulomatosis with polyangiitis)

Osteonecrosis of the jaw
Evaluation following non-diagnostic Panorex/radiographs

Sinus and nasal indications
Diagnosis or management (including perioperative evaluation) of the following:
- Anosmia
- Foreign body in the maxillofacial region
- Mucocele of paranasal sinuses
- Nasal airway obstruction refractory to medical therapy
- Polyposis
- Recurrent epistaxis
Common Diagnostic Indications

**Sinusitis, acute and subacute**
(any one of the following)
- Screening of immunocompromised patient or a patient who is likely to become immunocompromised by therapy (for example, prior to chemotherapy or transplant)
- Management of complications of acute sinusitis (any one of the following)
  - Abscess, intracranial or orbital
  - Encephalitis or cerebritis
  - Meningitis
  - Sinus thrombosis
  - Invasive fungal sinusitis in immunocompromised patients

*Note:* Any episode of sinusitis with duration of less than 30 (acute) or 31-90 (subacute) days. Sinusitis is generally rare in patients under 3 years of age.

**Sinusitis, chronic or recurrent**
(any one of the following)
- Corroborate diagnosis of chronic sinusitis prior to a prolonged course of antibiotics
- Diagnose underlying medical condition (any one of the following)
  - Chronic allergies or asthma
  - Ciliary motility disorder
  - Craniofacial abnormality
  - Cystic fibrosis
  - Immunodeficiency
- Diagnose unilateral sinusitis
- Post-operative management of complications
- Pre-operative evaluation to determine whether the patient is a surgical candidate
- Pre-operative image guidance study

*Note:* Any episode of sinusitis that persists beyond ninety (90) days. Indication includes recurrent acute bacterial sinusitis (RABS), defined as episodes of sinusitis lasting less than 30 days with at least 10 symptom-free days in-between. At least three (3) such episodes within six (6) months or four (4) episodes within a year are required to qualify.

**Temporomandibular disease (TMD)**
Diagnosis of a temporomandibular joint (TMJ) source of TMD when at least one of the following applies:
- Panorex is inconclusive or not available
- Panorex findings are unclear or require further characterization:
  - Panorex is normal but high clinical suspicion for TMJ pathology remains and the results will change management (including perioperative evaluation)

*Note:* Temporomandibular disease is a collective term, which includes disorders of both the masticatory muscles and the TMJ. CT is generally not indicated when a muscular etiology for TMD is suspected. Most TMJ pathology can be evaluated with a Panorex radiograph.

**Trauma to the facial bones**

**Tumor or mass lesion in the sinus or nasal region**
Diagnosis or management (including perioperative evaluation) of benign or malignant tumor
References

CPT Codes

70336.............. MRI of Temporomandibular Joint(s)

Standard Anatomic Coverage

- Bilateral study, including open and closed mouth views, often performed with surface coils
- Images may be obtained in axial, (oblique) sagittal and (oblique) coronal planes

Common Diagnostic Indications

Abnormal imaging findings

Follow up of abnormal or indeterminate findings on a prior imaging study when required to direct treatment

Arthropathy of the temporomandibular joints

Following non-diagnostic radiograph, or Panorex view of the TMJ

Examples include traumatic, inflammatory or infectious arthritis

Frozen jaw

Juvenile idiopathic arthritis (JIA)

Management of JIA when radiographs are not sufficient to guide therapy

Temporomandibular joint dysfunction

Evaluation of persistent symptoms when all of the following requirements are met:

- X-ray or Panorex has not provided sufficient information to guide treatment.
- Intervention is being considered.
- Symptoms have not improved with conservative treatment, including NSAIDs or acetaminophen, a short-term trial of soft diet and proper chewing techniques, and an oral appliance (such as a bite block).

Trauma to the temporomandibular joints

- Evaluation of meniscal position and integrity

Note: Conventional radiographs, Panorex views or CT of the TMJ are preferred for initial evaluation of trauma.

Standard Anatomic Coverage

- Axial images from the skull base to the clavicles

Technology Considerations

- CT is generally the modality of choice for the following indications: detection of sialolithiasis (salivary gland calculi); following trauma to the soft tissues of the neck; and during foreign body evaluation, after initial radiographic assessment for a radiopaque foreign body

Common Diagnostic Indications

Abnormal imaging findings

- Follow up of abnormal or indeterminate findings on a prior imaging study when required to direct treatment

Congenital anomaly

- Diagnosis or management (including perioperative evaluation) of a suspected or known congenital or developmental anomaly of the soft tissue structures of the neck

Foreign body in the upper aerodigestive tract or surrounding neck tissue

- Following non-diagnostic neck radiograph

Hoarseness, dysphonia, or vocal cord weakness/paralysis

- Following laryngoscopy, when vocal cord paralysis is demonstrated, or study is non-diagnostic
- Evaluation of symptoms persisting longer than one month when laryngoscopy has not been performed

Horner’s syndrome

Infectious disease

- Diagnosis or management (including perioperative evaluation) of infection involving soft tissue structures in the neck

Inflammatory disease

- Diagnosis or management of inflammatory disease involving soft tissue structures in the neck

Laryngeal edema
Common Diagnostic Indications

Lymphadenopathy
Evaluation of unexplained lymphadenopathy in any of the following clinical scenarios:

- Ultrasound findings suggestive of nodal malignancy
- Non-diagnostic ultrasound and failure to resolve following a six (6) week course of empiric therapy
- Non-diagnostic ultrasound and presence of at least one* of the following features:
  - Absence of pain or tenderness
  - Constitutional symptoms
  - Firm/immobile and size greater than 3 cm in diameter
  - Persistent enlargement on exam for longer than 2 weeks
  - Presence of ulceration
  - Supraclavicular or posterior triangle location

*Note: Biopsy may be more appropriate than imaging when any of these features are present.

Neck mass
- Initial evaluation of a palpable neck mass when ultrasound demonstrates a solid mass other than a lymph node
- Management of known cystic neck mass or other benign tumor when ultrasound is not sufficient to guide treatment
- Evaluation of a retropharyngeal neck mass

Osteonecrosis of the jaw
Evaluation following non-diagnostic X-ray or Panorex

Parathyroid adenoma
- Evaluation of suspected adenoma following abnormal parathyroid ultrasound or scintigraphy
- Preoperative planning in patients with aberrant anatomy
- Localization of residual parathyroid tissue following failed parathyroidectomy

Salivary/parotid gland ductal calculi

Stridor
- Evaluation of acute stridor
- For subacute or chronic stridor, following non-diagnostic radiograph and ENT evaluation

Thyroid nodule or thyromegaly (goiter)
- Following non-diagnostic thyroid ultrasound or thyroid scintigraphy
- When associated with mass effect on the upper airway or esophagus
- For preoperative evaluation

Torticollis
- Evaluation of childhood (acquired) torticollis when clinical findings that suggest a secondary cause (such as infection, neoplasm, or trauma)
- Evaluation of congenital muscular torticollis when all of the following apply:
  - Age 8 months or younger
  - Non-diagnostic ultrasound of the neck
  - Non-diagnostic cervical spine X-ray
  - Failure to respond to at least four (4) weeks of conservative treatment

Tracheal stenosis

Traumatic injury to soft tissues structures of the neck
Common Diagnostic Indications

Tumor (benign or malignant)
Diagnosis or management (including perioperative evaluation) of suspected or known malignancy

Upper airway obstruction

Angiography includes imaging of all blood vessels (arteries and veins). The above CPT codes include venography.

Standard Anatomic Coverage

- CTA and MRA of the neck involve image acquisitions from the aortic arch to the skull base, to visualize major vessels which include the extracranial carotid arteries and vertebral arteries. The major venous structures may also be interrogated with CT and MR angiographic techniques.

Choice of Imaging Study

- Duplex Doppler ultrasound is a first line imaging study for most carotid indications.

Advantages of CTA

- Higher sensitivity for detection of mural calcification
- Absence of in-plane flow phenomenon which can exaggerate the degree of stenosis
- Improved detection of surgical clips and stents
- Shorter scan time, resulting in less motion artifact and better quality images

Advantages of MRA

- Provides information about the age of blood
- No need for iodinated contrast material
- No exposure to ionizing radiation

Common Diagnostic Indications

Abnormal imaging findings
Follow up of abnormal or indeterminate findings on a prior imaging study when required to direct treatment

Aneurysm or dissection of carotid or vertebral arteries

Carotid stenosis or occlusion
Diagnosis or management of known or suspected steno-occlusive disease

- Following abnormal or equivocal duplex Doppler study, unless the diagnosis is supported by clinical exam findings.

Examples include Moyamoya disease, sickle cell anemia, and idiopathic progressive arteriopathy of childhood.

Congenital or developmental vascular anomaly
Diagnosis or management (including perioperative evaluation) of a vascular anomaly of the carotid or vertebral arteries including arteriovenous malformation (AVM)

Horner’s syndrome

Intramural hematoma
Common Diagnostic Indications

Post-operative or post-procedure evaluation

Note: This indication is for post-operative evaluation of conditions not specifically referenced elsewhere in this guideline.

Preoperative or pre-procedure evaluation

Note: This indication is for preoperative evaluation of conditions not specifically referenced elsewhere in this guideline.

Exclusion:
- MRV (or CTV) in preparation for either a neurosurgical or percutaneous procedure to treat multiple sclerosis is not considered appropriate.

Thromboembolic disease of major extracranial arterial and/or venous systems

Traumatic vascular injury to the extracranial carotid and vertebral arteries

Vasculopathy (including fibromuscular dysplasia and vasculitis)

Venous thrombosis or compression

Vertebrobasilar stenosis or occlusion
